

**Figure 4.4.7** Histogram showing percentages of each highly cultivated soil type's fields' estimated soil loss rankings.  
 \* Slope values are based on NSS (1989) soil type descriptions and their effects on estimated soil loss range are calculated by multiplying the median amount of soil loss by the range of LS-factors that correspond to the range of slope values; clay and OMC values are from Table 4.3.2 and areas are from Table 4.2.2.
